

AI-assisted Transactional Tracker Concept

AI Adoption Initiative Design Canvas

Section 2 — Target Audience

- **Name/roles:** Compensation staff, especially analysts and managers who prepare or use transactional tracking summaries and dashboard reports.
- **Current AI fluency (1–5):** 1–2.
- **What they need:** A practical way to organize messy tracker data, identify missing fields, and prepare cleaner dashboard-ready summaries.
- **Likely concern:** That the data is too sensitive and AI may create security, accuracy, or trust problems.

Section 1 — Problem Statement

Compensation transactional trackers in Smartsheet can be messy, incomplete, and difficult to reconcile with UAccess Analytics reports. This slows annual and ad hoc analysis, reduces trust in summaries, and creates extra manual work before dashboards can be built. A masked-data AI concept could improve reporting readiness.

Section 3 — AI Tools and Approach

- **Tool 1:** Secure, approved AI environment.
 - Modality: Text/structured AI support.
 - Rationale: Could help identify gaps, suggest field mappings, and support summary drafting.
 - Data sensitivity: High because real data includes names, IDs, salaries, and raise amounts.
 - Institutional approval: Required before any real-data pilot.
- **Tool 2:** Python or spreadsheet-based preparation tools.
 - Modality: Code/tabular data processing.
 - Rationale: Help prepare, compare, and clean tracker/UAccess Analytics data structures.
 - Data sensitivity: High if using real data; lower if using masked or synthetic data.
 - Institutional approval: Acceptable for concept-stage work on masked/synthetic data; production use requires authorization.

Section 4 — Ethical Safeguards

- **Risk:** Exposure of highly sensitive compensation data.
 - Safeguard: Keep the initiative at the design stage unless secure environment, controls, and authorization are in place.
 - Responsible party: Compensation leadership, analysts, HR/IT reviewers.
- **Risk:** Incorrect matching between Smartsheet and UAccess fields.
 - Safeguard: Require human review of any AI-suggested reconciliation.
 - Responsible party: Participating analysts.
- **Risk:** Over-trust in automated summaries.
 - Safeguard: Final dashboard interpretation and reporting decisions stay with Compensation staff.
 - Responsible party: Compensation staff and leadership.

Section 5 — Equity Considerations

- **Population 1:** Employees whose transactions are unusual, incomplete, or involve multiple positions.
 - Adjustment: Flag those rows for manual review rather than forcing automated assumptions.
- **Population 2:** Analysts with lower confidence using new tools or AI-supported outputs.
 - Adjustment: Start with a narrow proof of concept, simple written guidance, and transparent review steps.

Section 6 — Success Metrics

- **Metric 1:** Reporting-readiness improvement.
 - How measured: Reduction in missing-field follow-up and cleaner reconciliation across sources.
 - Timeline: During proof of concept.
 - Minimum acceptable threshold: Clear improvement without compromising data handling.
- **Metric 2:** Clarity/usefulness for analysts.
 - How measured: Analyst feedback on whether outputs are easier to interpret and use.
 - Timeline: End of proof of concept.

- Minimum acceptable threshold: Analysts judge the concept helpful enough to consider future exploration.
- **Metric 3:** Governance decision quality.
 - How measured: Whether the project yields a clear recommendation—move forward later, revise, or stop.
 - Timeline: End of initial concept phase.
 - Minimum acceptable threshold: A documented, defensible recommendation is produced.

Section 7 — Rollout Plan — First Three Steps

- **Step 1:** Document the current workflow for combining Smartsheet tracker data with UAccess Analytics data and note common mismatches.
 - Who: You, with optional analyst input.
 - Resource needed: Current tracker examples and workflow notes.
 - By what date: Within 2 weeks.
- **Step 2:** Build a small proof of concept using masked or synthetic data.
 - Who: Gina.
 - Resource needed: Synthetic dataset, Python/spreadsheet tools, simple test criteria.
 - By what date: Weeks 3–5.
- **Step 3:** Share findings with the Compensation Manager and recommend whether to move forward, revise, defer, or stop.
 - Who: Gina.
 - Resource needed: Concept notes, example outputs, risk summary.
 - By what date: Within 45–60 days.

50-word elevator pitch

This concept explores whether AI could help Compensation clean and reconcile messy Smartsheet transaction trackers with UAccess Analytics reports so dashboard work begins from more complete and usable data. Because the data is highly sensitive, the idea starts only as a masked-data proof of concept, not immediate production use.
